

Backend Developer Core- Java

Who We Are

At Yuno, we are building the payment infrastructure that enables companies to participate seamlessly in the global market. Founded by experienced leaders from the payments and technology industries, our platform provides access to world-class payment capabilities, helping businesses engage customers with confidence and operate globally through seamless integrations.

We empower high-performing teams at brands such as InDrive, McDonald's, Rappi, and Viva Aerobus to integrate over 1,000 payment methods through a single API. By leveraging advanced AI and cutting-edge technology, we enable smart routing and fraud prevention across 80+ countries.

Yuno acts as a payment orchestration layer, allowing merchants to access 400+ payment methods via one unified API.

About the Role

At Yuno, we are building a high-performing, globally distributed team driven by innovation and impact.

The Backend Core Engineering Team is responsible for building and implementing the core payment orchestration logic, as well as developing business intelligence systems to determine the most optimal payment methods.

The process is divided into three key stages:

1. **Analysis** - A detailed document outlining all product-level requirements and specifications for development.
2. **Development** - Implementation of the defined requirements and orchestration logic.
3. **QA & Go-Live** - Testing and deployment, using all provided documentation as supporting material.

Deliverables

- Public GitHub repository link
- Test case documentation

GitHub Repository Expectations

- Technology stack: **Java or Kotlin**
- Include a well-structured **README file** with:
 - Installation steps
 - Execution guide

Documentation Requirements

Your documentation should cover:

- Comprehensive **test case scenarios**, including **negative test cases**
- Classification of test cases based on importance:
 - **Sanity**
 - **Regression**
 - **Integration**
- Clearly defined:
 - **Functional requirements**
 - **Non-functional requirements**
- A **high-level overview** explaining how the functionality fits into the broader system
- Well-defined:
 - **Integration points**
 - **Input and output parameters**
- Documentation of **prompts used during development (vibe coding)**
- Performance considerations, including **capturing relevant metrics where possible**

Usage of AI Tools

- The use of **vibe coding** is encouraged
- Engineers are expected to craft **high-quality prompts** that generate performant code aligned with Yuno's coding standards

Evaluation Criteria

- **Originality of Work** - Submissions will be assessed for originality and adherence to best coding practices.
- **Documentation & Understanding** - Candidates should include clear comments and detailed documentation explaining their approach, decisions, and implementation. This helps evaluate both technical depth and clarity of thought.
- **Integrity** - All submissions must reflect the candidate's own effort. Any form of plagiarism or misuse of automated tools that compromises the integrity of the challenge will be considered a violation.

Assessment Parameters

- **Repository & Setup**
- **Technical Automation Design**
- **Test Coverage & Negative Scenarios**
- **Documentation Quality**
- **Bonus:** Critical thinking and additional improvements

Assignment:

Overview

This assignment evaluates backend engineering skills through the development of a simplified payment orchestration system, inspired by real-world platforms like Yuno. The focus is on delivering a comprehensive backend functionality implementation.

Architecture Diagram

Functional Requirements

- Create Payment API
- Fetch Payment API
- Routing (CARD → A, UPI → B)
- Retry & Failover
- Idempotency
- Payment Status Tracking

Technical Requirements

- Feel free to use either Java or Kotlin

- As mentioned above provide the detailed documentation
- List all the test cases including positives and negative test scenarios
- Automated Unit Test cases are good to have

Your Contributions

- Improve the **reliability, quality, and time-to-market** of our software solutions
- Monitor and analyze **system performance** to anticipate and meet customer needs
- Provide **operational support and engineering expertise**
- Research, deploy, maintain, and troubleshoot infrastructure across all environments
- Analyze system and application metrics for **performance tuning and issue resolution**
- Collaborate with development teams to enhance services through **observability**
- Manage incidents, conduct **blameless postmortems**, and perform root cause analysis
- Proactively bring ideas and solutions, we value initiative and ownership

Skills You Need

Minimum Qualifications

- Fluent in **English**
- Familiarity with **security best practices** (servers and containers)
- Strong **troubleshooting and problem-solving skills**
- Detail-oriented with a **strategic and critical thinking mindset**
- Proficiency in **Java or Kotlin (expertise in one)**
- Experience with **unit testing**
- Strong understanding of **Git**
- Ability to communicate complex technical concepts to **both technical and business audiences**
- Working knowledge of **SQL and PostgreSQL**
- Awareness of **OWASP security principles**
- Adaptability to a **fast-changing roadmap**
- Willingness to learn new technologies and frameworks

Preferred Qualifications

- Curiosity and enthusiasm for solving **complex technical challenges**
- Ability to work **independently and take ownership**
- **Knowledge of vibe coding**

Nice to Have

- Experience in the **payments industry**
- Experience integrating **Payment Service Providers (PSPs)**
- Basic knowledge of **frontend technologies**
